\end{array}
\]

Euler’s definition

\[ \sum_{i \geq 1} i^n t^i = \frac{t A_n(t)}{(1 - t)^{n+1}} \]

Euler’s exponential generating function formula

\[ \sum_{n \geq 0} \frac{A_n(t) z^n}{n!} = \frac{1 - t}{e(t-1)z - t} = \frac{(1 - t)e^z}{e^{tz} - te^z} \]
For $\sigma \in S_n$,  

Descent set: $\text{DES}(\sigma) := \{ i \in [n - 1] : \sigma(i) > \sigma(i + 1) \}$

$\sigma = 3.25.4.1$  \quad $\text{DES}(\sigma) = \{1, 3, 4\}$

Define $\text{des}(\sigma) := |\text{DES}(\sigma)|$. So

$\text{des}(32541) = 3$
Eulerian polynomials - combinatorial interpretation

For $\sigma \in \mathcal{S}_n$,

**Descent set:**  
$$\text{DES}(\sigma) := \{i \in [n-1] : \sigma(i) > \sigma(i+1)\}$$

$\sigma = 3.25.4.1 \quad \text{DES}(\sigma) = \{1, 3, 4\}$

Define $\text{des}(\sigma) := |\text{DES}(\sigma)|$. So

$$\text{des}(32541) = 3$$

**Excedance set:**  
$$\text{EXC}(\sigma) := \{i \in [n-1] : \sigma(i) > i\}$$

$\sigma = 32541 \quad \text{EXC}(\sigma) = \{1, 3\}$

Define $\text{exc}(\sigma) := |\text{EXC}(\sigma)|$. So

$$\text{exc}(32541) = 2$$
Eulerian polynomials - combinatorial interpretation

**Theorem (MacMahon 1905)**

$$\sum_{\sigma \in \mathcal{S}_n} q^{\text{inv}(\sigma)} = \sum_{\sigma \in \mathcal{S}_n} q^{\text{maj}(\sigma)} = [n]_q!$$

where $[n]_q := 1 + q + \cdots + q^{n-1}$ and $[n]_q! := [n]_q[n - 1]_q \cdots [1]_q$
q-Eulerian polynomials

\[ A_{n, \text{inv, des}}(q, t) := \sum_{\sigma \in S_n} q^{\text{inv}(\sigma)} t^{\text{des}(\sigma)} \]

\[ A_{n, \text{maj, des}}(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}(\sigma)} t^{\text{des}(\sigma)} \]

\[ A_{n, \text{inv, exc}}(q, t) := \sum_{\sigma \in S_n} q^{\text{inv}(\sigma)} t^{\text{exc}(\sigma)} \]

\[ A_{n, \text{maj, exc}}(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}(\sigma)} t^{\text{exc}(\sigma)} \]
q-Eulerian polynomials

\[ A_n^{\text{inv, des}}(q, t) := \sum_{\sigma \in S_n} q^{\text{inv}(\sigma)} t^{\text{des}(\sigma)} \]

\[ A_n^{\text{maj, des}}(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}(\sigma)} t^{\text{des}(\sigma)} \]

\[ A_n^{\text{inv, exc}}(q, t) := \sum_{\sigma \in S_n} q^{\text{inv}(\sigma)} t^{\text{exc}(\sigma)} \]

\[ A_n^{\text{maj, exc}}(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}(\sigma)} t^{\text{exc}(\sigma)} \]

Theorem (MacMahon, 1916; Carlitz, 1954)

\[ \sum_{i \geq 1} [i]_q^n t^i = \frac{t A_n^{\text{maj, des}}(q, t)}{\prod_{i=0}^{n} (1 - t q^i)} \]
q-analogs of Euler’s exp. generating function formula

**Theorem (Stanley, 1976)**

\[
\sum_{n \geq 0} A_{n}^{\text{inv,des}}(q, t) \frac{z^n}{[n]_q!} = \frac{1 - t}{\operatorname{Exp}_q(z(t - 1)) - t}
\]

where

\[
\operatorname{Exp}_q(z) := \sum_{n \geq 0} \frac{q^{(n)}_2 z^n}{[n]_q!}
\]
q-analogs of Euler’s exp. generating function formula

Theorem (Stanley, 1976)

\[
\sum_{n \geq 0} A_{n}^{\text{inv,des}}(q, t) \frac{z^{n}}{[n]_q!} = \frac{1 - t}{\text{Exp}_q(z(t - 1)) - t}
\]

where

\[
\text{Exp}_q(z) := \sum_{n \geq 0} \frac{q^\binom{n}{2}}{[n]_q!} z^n
\]

Theorem (Shareshian-W., 2006)

\[
\sum_{n \geq 0} A_{n}^{\text{maj,exc}}(q, t) \frac{z^{n}}{[n]_q!} = \frac{(1 - t q) \exp_q(z)}{\exp_q(z t q) - t q \exp_q(z)}
\]

where

\[
\exp_q(z) := \sum_{n \geq 0} \frac{z^n}{[n]_q!}
\]
We use symmetric function theory and bijective combinatorics to prove this.
We use symmetric function theory and bijective combinatorics to prove this.

From now on the $q$-Eulerian polynomials and the $q$-Eulerian numbers are

$$A_n(q, t) := A_{n, \text{maj, exc}}^\text{major, exc}(q, tq^{-1}) = \sum_{\sigma \in S_n} q^{\text{maj}(\sigma) - \text{exc}(\sigma)} t^{\text{exc}(\sigma)}$$

$$\langle n \rangle_q := \sum_{\sigma \in S_n, \text{exc}(\sigma) = j} q^{\text{maj}(\sigma) - \text{exc}(\sigma)}$$

So the result with Shareshian becomes

$$\sum_{n \geq 0} A_n(q, t) \frac{z^n}{[n]_q!} = \frac{(1 - t) \exp_q(z)}{\exp_q(zt) - t \exp_q(z)}$$
Theorem (Shareshian-W., 2006)

The $q$-Eulerian polynomial $A_n(q, t) = \sum_{t=0}^{n-1} \langle \binom{n}{j} \rangle_q t^j$ is

- *palindromic* in the sense that $\langle \binom{n}{j} \rangle_q = \langle \binom{n}{n-1-j} \rangle_q$ for $0 \leq j \leq \frac{n-1}{2}$

- *$q$-unimodal* in the sense that $\langle \binom{n}{j} \rangle_q - \langle \binom{n}{j-1} \rangle_q \in \mathbb{N}[q]$ for $1 \leq j \leq \frac{n-1}{2}$
Let $\omega$ be the involution on the ring of symmetric functions that takes the elementary symmetric functions $e_n$ to the complete homogeneous symmetric functions $h_n$.

For a homogeneous symmetric function $f(x_1, x_2, \ldots)$ of degree $n$ with coefficients in ring $R$, the stable principal specialization of $f$ is

$$
\text{ps}_q (f(x_1, x_2, \ldots)) = f(1, q, q^2, \ldots) \prod_{i=1}^{n} (1 - q^i) \in R[q].
$$
Let \( \omega \) be the involution on the ring of symmetric functions that takes the elementary symmetric functions \( e_n \) to the complete homogeneous symmetric functions \( h_n \).

For a homogeneous symmetric function \( f(x_1, x_2, \ldots) \) of degree \( n \) with coefficients in ring \( R \), the stable principal specialization of \( f \) is

\[
\psi_q(f(x_1, x_2, \ldots)) = f(1, q, q^2, \ldots) \prod_{i=1}^{n} (1 - q^i) \in R[q].
\]

Let \( W_n := \{ w \in \mathbb{Z}_{>0}^n : w_i \neq w_{i+1} \ \forall i \} \) (Smirnov words) and let

\[
W_n(x, t) := \sum_{w \in W_n} t^{\text{des}(w)} x_{w_1} \cdots x_{w_n}.
\]

Example: \( 37572 \in W_5 \) contributes \( t^2 x_2 x_3 x_5 x_7^2 \) to \( W_5(x, t) \).
A symmetric function analog of the Eulerian polynomials

- Let $\omega$ be the **involution** on the ring of symmetric functions that takes the elementary symmetric functions $e_n$ to the complete homogeneous symmetric functions $h_n$.
- For a homogeneous symmetric function $f(x_1, x_2, \ldots)$ of degree $n$ with coefficients in ring $R$, the **stable principal specialization** of $f$ is

\[
ps_q (f(x_1, x_2, \ldots)) = f(1, q, q^2, \ldots) \prod_{i=1}^{n} (1 - q^i) \in R[q].
\]

Let $W_n := \{ w \in \mathbb{Z}_n^+ : w_i \neq w_{i+1} \ \forall i \}$ (Smirnov words) and let

\[
W_n(x, t) := \sum_{w \in W_n} t^{\text{des}(w)} x_{w_1} \cdots x_{w_n}.
\]

**Theorem (Shareshian-W., 2006)**

\[
A_n(q, t) = ps_q(\omega W_n(x, t))
\]
A proper coloring of a graph $G = (V, E)$ is a map $c : V \to C$ such that $c(u) \neq c(v)$ if $\{u, v\} \in E$.

The chromatic polynomial $\chi_G(m)$ of a graph $G$ is defined to be the number of proper colorings $c : V \to C$ where $|C| = m$. 

Birkhoff introduced this for planar graphs in 1912 as a means of proving the four color theorem. Whitney generalized this to all graphs in 1932.
A **proper coloring** of a graph \( G = (V, E) \) is a map \( c : V \to C \) such that \( c(u) \neq c(v) \) if \( \{u, v\} \in E \).

The **chromatic polynomial** \( \chi_G(m) \) of a graph \( G \) is defined to be the number of proper colorings \( c : V \to C \) where \( |C| = m \).

\[
V = [n] := \{1, \ldots, n\} \\
E = \{\{i, i+1\} : i \in [n-1]\}
\]

\[
\chi_G(m) = m(m-1)^{n-1} \in \mathbb{Z}[m]
\]
A **proper coloring** of a graph \( G = (V, E) \) is a map \( c : V \to C \) such that \( c(u) \neq c(v) \) if \( \{u, v\} \in E \).

The **chromatic polynomial** \( \chi_G(m) \) of a graph \( G \) is defined to be the number of proper colorings \( c : V \to C \) where \( |C| = m \).

\[
V = [n] := \{1, \ldots, n\} \\
E = \{\{i, i + 1\} : i \in [n - 1]\}
\]

\[
\chi_G(m) = m(m - 1)^{n-1} \in \mathbb{Z}[m]
\]

Birkhoff introduced this for planar graphs in 1912 as a means of proving the four color theorem. Whitney generalized this to all graphs in 1932.
Let $C(G)$ be set of proper colorings $c : [n] \to \mathbb{Z}_{>0}$ of graph $G = ([n], E)$.

$$X_G(x) := \sum_{c \in C(G)} x_{c(1)}x_{c(2)} \cdots x_{c(n)}$$

$$X_G(1, 1, \ldots, 1, 0, 0, \ldots) = \chi_G(m)$$
Let $C(G)$ be set of proper colorings $c : [n] \rightarrow \mathbb{Z}_{>0}$ of graph $G = ([n], E)$.

$$X_G(x) := \sum_{c \in C(G)} x_{c(1)}x_{c(2)} \cdots x_{c(n)}$$

$X_G(1, 1, \ldots, 1, 0, 0, \ldots) = \chi_G(m)$

When $G$ is the path with $n$ nodes, $X_G(x) = W_n(x, 1)$. 
A refinement

Chromatic quasi symmetric function (Shareshian-W., 2011)

\[ X_G(x, t) := \sum_{c \in C(G)} t^{\text{des}_G(c)} x_{c(1)}x_{c(2)} \cdots x_{c(n)} \]

where

\[ \text{des}_G(c) := |\{\{i,j\} \in E(G) : i < j \text{ and } c(i) > c(j)\}|. \]

When \( G \) is the path with \( n \) nodes, \( X_G(x, t) = W_n(x, t) \) and so

\[ A_n(q, t) = \text{ps}_q(\omega X_G(x, t)) \]
When is $X_G(x, t)$ symmetric?

Given a collection of $n$ unit intervals $I_1, \ldots, I_n$ on $\mathbb{R}$, labeled from left to right, form a labeled graph $G = ([n], E)$, where

$$E = \{\{i, j\} : I_i \cap I_j \neq \emptyset\}.$$

This is called a natural unit interval graph.

Example.
When is $X_G(x, t)$ symmetric?

**Examples:** Let $G_{n,r}$ be the graph with vertex set $\{1, 2, \ldots, n\}$ and edge set $\{\{i, j\} \mid 0 < |j - i| \leq r\}$.

$G_{4,1}$ is the path: 

\[
\begin{array}{cccc}
1 & 2 & 3 & 4 \\
\end{array}
\]

$G_{4,2}$ is the graph:

\[
\begin{array}{cccc}
1 & 2 & 3 & 4 \\
\end{array}
\]

$G_{n,n-1}$ is the complete graph $K_n$. 

Theorem (Shareshian-W., 2011)

If $G$ is a natural unit interval graph then $X_G(x, t)$ is symmetric in $x$ and palindromic (as a polynomial in $t$).
When is $X_G(x, t)$ symmetric?

**Examples:** Let $G_{n,r}$ be the graph with vertex set \{1, 2, \ldots, n\} and edge set \{\{i, j\} \mid 0 < |j - i| \leq r\}.

$G_{4,1}$ is the path: 

![Path of 4 vertices](image)

$G_{4,2}$ is the graph: 

![Graph of 4 vertices](image)

$G_{n,n-1}$ is the complete graph $K_n$.

**Theorem (Shareshian-W., 2011)**

*If $G$ is a natural unit interval graph then $X_G(x, t)$ is symmetric in $x$ and palindromic (as a polynomial in $t$).*

\[
X_{G_{3,1}} = e_3 + (e_3 + e_{2,1})t + e_3 t^2 \\
X_{G_{4,1}} = e_4 + (e_4 + e_{3,1} + e_{2,2})t + (e_4 + e_{3,1} + e_{2,2})t^2 + e_4 t^3
\]
Let $G$ be a natural unit interval graph.

**Conjecture (Shareshian-W., ’11 )**

$X_G(x, t)$ is e-positive and e-unimodal.

True for

- $G_{n,1}$ and $G_{n,r}, r \geq n - 3$ (Shareshian-W., 2011)
- various infinite classes (Shareshian-W., 2014; Cho-Huh, 2018)
- computer verification up to $n = 9$
Let $G$ be a natural unit interval graph.

**Conjecture (Shareshian-W., '11)**

$X_G(x, t)$ is *e-positive and e-unimodal*.

True for

- $G_{n,1}$ and $G_{n,r}$, $r \geq n - 3$ (Shareshian-W., 2011)
- various infinite classes (Shareshian-W., 2014; Cho-Huh, 2018)
- computer verification up to $n = 9$

**Theorem (Shareshian-W., '14)**

$X_G(x, t)$ is *Schur-positive*.
Refinement of Stanley-Stembridge $e$-positivity conjecture

Let $G$ be a natural unit interval graph.

Conjecture (Shareshian-W., '11)

$X_G(x, t)$ is $e$-positive and $e$-unimodal.

True for

- $G_{n,1}$ and $G_{n,r}$, $r \geq n - 3$ (Shareshian-W., 2011)
- various infinite classes (Shareshian-W., 2014; Cho-Huh, 2018)
- computer verification up to $n = 9$

Theorem (Shareshian-W., '14)

$X_G(x, t)$ is Schur-positive.

Theorem (Shareshian-W. '14, Athanasiadis,'15)

$\omega X_G(x, t)$ is $p$-positive.

($t = 1$ Schur positivity: Haiman, 1993, Gasharov, 1993; $t = 1$ $p$-positivity: Stanley for all graphs.)
Specializing $\omega X_{G_{n,r}}(x, t)$

Let $1 \leq r \leq n - 1$. Our refinement of the Stanley-Stembridge conjecture implies: $p_{s_q}(\omega X_{G_{n,r}}(x, t))$ is palindromic and $q$-unimodal.
Specializing $\omega X_{G_n,r}(x, t)$

Let $1 \leq r \leq n - 1$. Our refinement of the Stanley-Stembridge conjecture implies: $\text{ps}_q(\omega X_{G_n,r}(x, t))$ is palindromic and $q$-unimodal.

Let $A^{(r)}_n(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}_r(\sigma)} t^{\text{inv}_r(\sigma)}$ where

\[
\text{inv}_r(\sigma) := |\{(i, j) : 1 \leq i < j \leq n, \quad 0 < \sigma(i) - \sigma(j) \leq r\}|
\]

\[
\text{DES}_r(\sigma) := \{i \in [n - 1] : \sigma(i) - \sigma(i + 1) > r\}
\]

\[
\text{maj}_r(\sigma) := \sum_{i \in \text{DES}_r} i
\]

**Theorem (Shareshian-W., 2011)**

\[
\text{ps}_q(\omega X_{G_n,r}(x, t)) = A^{(r)}_n(q, t)
\]

Consequently $A^{(1)}_n(q, t) = A_n(q, t)$.

Proof involves quasisymmetric function theory.
A_{n}^{(r)}(q, t) := \sum_{\sigma \in S_{n}} q^{\text{maj}_{> r}(\sigma)} t^{\text{inv}_{\leq r}(\sigma)}

Exercise (Stanley EC1, 1.50 f): Prove that \( \sum_{\sigma \in S_{n}} t^{\text{inv}_{\leq r}(\sigma)} \) is palindromic and unimodal.

Solution:
\[ A_n^{(r)}(q, t) := \sum_{\sigma \in \mathfrak{S}_n} q^{\text{maj}_r(\sigma)} t^{\text{inv} \leq r(\sigma)} \]

Exercise (Stanley EC1, 1.50 f): Prove that \( \sum_{\sigma \in \mathfrak{S}_n} t^{\text{inv} \leq r(\sigma)} \) is palindromic and unimodal.

Solution:

Theorem (De Mari and Shayman - 1988)

Let \( \mathcal{H}_{n,r} \) be the type \( A_{n-1} \) regular semisimple Hessenberg variety of degree \( r \). Then

\[
\sum_{\sigma \in \mathfrak{S}_n} t^{\text{inv} \leq r(\sigma)} = \sum_{j=0}^{d(n,r)} \dim H^{2j}(\mathcal{H}_{n,r}) t^j
\]

Consequently by the hard Lefschetz theorem, \( \sum_{\sigma \in \mathfrak{S}_n} t^{\text{inv} \leq r(\sigma)} \) is palindromic and unimodal.

Stanley: Is there a more elementary proof of unimodality?
\[ A_n^{(r)}(q, t) := \sum_{\sigma \in S_n} q^{\text{maj}_r(\sigma)} t^{\text{inv}_{\leq r}(\sigma)} \]

Exercise (Stanley EC1, 1.50 f): Prove that \( \sum_{\sigma \in S_n} t^{\text{inv}_{\leq r}(\sigma)} \) is palindromic and unimodal.
Solution:

**Theorem (De Mari and Shayman - 1988)**

Let \( \mathcal{H}_{n,r} \) be the type \( A_{n-1} \) regular semisimple Hessenberg variety of degree \( r \). Then

\[
\sum_{\sigma \in S_n} t^{\text{inv}_{\leq r}(\sigma)} = \sum_{j=0}^{d(n,r)} \dim H^{2j}(\mathcal{H}_{n,r}) t^j
\]

Consequently by the hard Lefschetz theorem, \( \sum_{\sigma \in S_n} t^{\text{inv}_{\leq r}(\sigma)} \) is palindromic and unimodal.

**Stanley:** Is there a more elementary proof of unimodality?
**Shareshian-W.:** Can we find a \( q \)-analog or a symmetric function analog?
The Frobenius characteristic is a linear map
\[ \text{ch} : \{ \text{virtual } S_n\text{-modules} \} \rightarrow \Lambda_n, \]
where \( \Lambda_n \) is the vector space of homogeneous symmetric functions of degree \( n \).

The image of the set of (actual) \( S_n\)-modules equals the set of Schur-positive symmetric functions of degree \( n \).

We need a representation of \( S_n \) on \( H^{2j}(\mathcal{H}_{n,r}) \) whose Frobenius characteristic is the coefficient of \( t^j \) in \( \omega \chi_{G_n, r}(x, t) \). It also has to commute with the hard Lefshetz map.

\[
\begin{align*}
H^{2j}(\mathcal{H}_{n,r}) & \xrightarrow{\text{ch}} \omega \chi_{G_n, r}(x, t)|_{t^j} \xrightarrow{\text{ps}_q} A_n^{(r)}(q, t)|_{t^j}.
\end{align*}
\]
The Frobenius characteristic is a linear map
\[ \text{ch} : \{ \text{virtual } \mathfrak{S}_n\text{-modules} \} \to \Lambda_n, \]
where \( \Lambda_n \) is the vector space of homogeneous symmetric functions of degree \( n \).

The image of the set of (actual) \( \mathfrak{S}_n \)-modules equals the set of Schur-positive symmetric functions of degree \( n \).

We need a representation of \( \mathfrak{S}_n \) on \( H^{2j}(\mathcal{H}_{n,r}) \) whose Frobenius characteristic is the coefficient of \( t^j \) in \( \omega X_{G_n,r}(x, t) \). It also has to commute with the hard Lefshetz map.

\[ H^{2j}(\mathcal{H}_{n,r}) \xrightarrow{\text{ch}} \omega X_{G_n,r}(x, t)|_{t^j} \xrightarrow{\text{ps}_q} A_n^{(r)}(q, t)|_{t^j} \]

Tymoczko (2008) used GKM theory (Goresky, Kottwitz, MacPherson) to obtain a representation of \( \mathfrak{S}_n \) on each cohomology.

Does this representation work for us?
De Mari, Procesi, Shayman (1992) extended the notion of semisimple Hessenberg variety so that $\mathcal{H}_m$ is defined for each sequence $m = (m_1 \leq \cdots \leq m_n)$ of integers satisfying $1 \leq i \leq m_i \leq n$. (Call these Hessenberg sequences.)

There is a bijection between natural unit interval graphs and Hessenberg sequences. Let

$$\mathcal{H}_G := \mathcal{H}_{m(G)}$$

where $m(G)$ is the Hessenberg sequence associated with natural unit interval graph $G$. 

Let $\operatorname{ch} H^{2j}(\mathcal{H}_G)$ be the Frobenius characteristic of Tymoczko’s representation of $\mathfrak{S}_n$ on $H^{2j}(\mathcal{H}_G)$. Then

$$\omega X_G(x, t) = \sum_{j \geq 0} \operatorname{ch} H^{2j}(\mathcal{H}_G) t^j.$$ 

Consequenlty, by the Hard Lefschetz Theorem $\omega X_G(x, t)$ is Schur unimodal.
Symmetric function analog

Conjecture (Shareshian and W., 2011)

Let $\text{ch} H^{2j}(\mathcal{H}_G)$ be the Frobenius characteristic of Tymoczko’s representation of $\mathfrak{S}_n$ on $H^{2j}(\mathcal{H}_G)$. Then

$$\omega X_G(x, t) = \sum_{j \geq 0} \text{ch} H^{2j}(\mathcal{H}_G) t^j.$$ 

Consequently, by the Hard Lefschetz Theorem $\omega X_G(x, t)$ is Schur unimodal.

If this conjecture is true then our refinement of the Stanley-Stembridge e-positivity conjecture is equivalent to:

Conjecture

Tymoczko’s representation of $\mathfrak{S}_n$ on $H^{2j}(\mathcal{H}_G)$ is a permutation representation for which each point stabilizer is a Young subgroup.
Let $\mathcal{F}_n$ be the set of all flags of subspaces of $\mathbb{C}^n$

$$F : F_1 \subset F_2 \subset \cdots \subset F_n = \mathbb{C}^n$$

where $\text{dim } F_i = i$.

The **type A regular semisimple Hessenberg variety** associated with natural unit interval graph $G$ is

$$\mathcal{H}_G := \{ F \in \mathcal{F}_n \mid DF_i \subseteq F_{m_i(G)} \quad \forall i \in [n] \},$$

where

- $D$ is the $n \times n$ diagonal matrix whose diagonal entries are $1, 2, \ldots, n$
- $m(G) = (m_1(G), m_2(G), \ldots, m_n(G))$ is the Hessenberg sequence associated with $G$. 

GKM theory and moment graphs

The group $T$ of nonsingular $n \times n$ diagonal matrices acts on

$$\mathcal{H}_G := \{ F \in \mathcal{F}_n \mid DF_i \subseteq F_{m_i(G)} \quad \forall i \in [n] \}.$$ 

by left multiplication.

**Moment graph:** graph whose vertices are $T$-fixed points and whose edges are one-dimensional orbits.

Fixed points of the torus action:

$$F_\sigma : \langle e_{\sigma(1)} \rangle \subset \langle e_{\sigma(1)}, e_{\sigma(2)} \rangle \subset \cdots \subset \langle e_{\sigma(1)}, \ldots, e_{\sigma(n)} \rangle$$

where $\sigma$ is a permutation.

So the vertices of the moment graph can be represented by permutations.
Let $G = ([n], E)$ be a natural unit interval graph. The moment graph $\Gamma(G)$ for the Hessenberg variety $\mathcal{H}_G$ has vertex set $\mathcal{S}_n$ and edge set $\{\sigma, \sigma(1,2)\}$.
Let $G = ([n], E)$ be a natural unit interval graph. The moment graph $\Gamma(G)$ for the Hessenberg variety $\mathcal{H}_G$ has vertex set $\mathcal{S}_n$ and edge set

$$\{\{\sigma, \sigma(i,j)\} : \sigma \in \mathcal{S}_n \text{ and } \{i,j\} \in E\}.$$
Let $G = ([n], E)$ be a natural unit interval graph. The moment graph $\Gamma(G)$ for the Hessenberg variety $\mathcal{H}_G$ has vertex set $S_n$ and edge set

$$\{\{\sigma, \sigma(i, j)\} : \sigma \in S_n \text{ and } \{i, j\} \in E\}.$$ 

Example: $n = 3$.

Color coded edge labels: (1,2) (2,3) (1,3)
The equivariant cohomology ring $H^*_T(\mathcal{H}_G)$

$H^*_T(\mathcal{H}_G)$ is isomorphic to a subring of $R_n := \prod_{\sigma \in S_n} \mathbb{C}[t_1, \ldots, t_n]$.

For $p \in R_n$, let $p_\sigma(t_1, \ldots, t_n) \in \mathbb{C}[t_1, \ldots, t_n]$ denote the $\sigma$-component of $p$, where $\sigma \in S_n$.

Color coded edge labels: (1,2) (2,3) (1,3)
The equivariant cohomology ring $H^*_T(\mathcal{H}_G)$

$H^*_T(\mathcal{H}_G)$ is isomorphic to a subring of $R_n := \prod_{\sigma \in S_n} \mathbb{C}[t_1, \ldots, t_n]$.

For $p \in R_n$, let $p_{\sigma}(t_1, \ldots, t_n) \in \mathbb{C}[t_1, \ldots, t_n]$ denote the $\sigma$-component of $p$, where $\sigma \in S_n$.

$p \in R_n$ satisfies the edge condition for the moment graph $\Gamma_G$ if for all edges $\{\sigma, \tau\}$ of $\Gamma(G)$ with label $(i, j)$, the polynomial

$$p_{\sigma}(t_1, \ldots, t_n) - p_{\tau}(t_1, \ldots, t_n)$$

is divisible by $t_i - t_j$.

$H^*_T(\mathcal{H}_G)$ is isomorphic to the subring of $R_n$ whose elements satisfy the edge condition for $\Gamma_G$. 

Color coded edge labels: (1,2) (2,3) (1,3)
Tymoczko’s representation

\[ \sigma \in \mathcal{S}_n \text{ acts on } p \in H^*_T(\mathcal{H}_G) \text{ by} \]

\[ (\sigma p)_\tau(t_1, \ldots, t_n) = p_{\sigma^{-1}\tau}(t_\sigma(1), \ldots, t_\sigma(n)) \]

Color coded edge labels: \((1,2)\) \((2,3)\) \((1,3)\)
Tymoczko’s representation

\[ \sigma \in \mathcal{S}_n \text{ acts on } p \in H^*_T(\mathcal{H}_G) \text{ by} \]

\[ (\sigma p)_\tau(t_1, \ldots, t_n) = p_{\sigma^{-1}\tau}(t_{\sigma(1)}, \ldots, t_{\sigma(n)}) \]

Color coded edge labels: \((1,2), (2,3), (1,3)\)

[Diagram of edge labels and permutations]
Tymoczko’s representation

\( \sigma \in S_n \) acts on \( p \in H^*_T(\mathcal{H}_G) \) by

\[
(\sigma p)_\tau(t_1, \ldots, t_n) = p_{\sigma^{-1}}(t_{\sigma(1)}, \ldots, t_{\sigma(n)})
\]

Color coded edge labels: \((1,2)\) \((2,3)\) \((1,3)\)
Tymoczko’s representation

$\sigma \in \mathfrak{S}_n$ acts on $p \in H_T^*(\mathcal{H}_G)$ by

$$(\sigma p)_\tau(t_1, \ldots, t_n) = p_{\sigma^{-1}\tau}(t_{\sigma(1)}, \ldots, t_{\sigma(n)})$$

Color coded edge labels: (1,2) (2,3) (1,3)

$H^*(\mathcal{H}_G) \cong H_T^*(\mathcal{H}_G)/\langle t_1, \ldots, t_n \rangle H_T^*(\mathcal{H}_G)$

The representation of $\mathfrak{S}_n$ on $H_T^*(\mathcal{H}_G)$ induces a representation on the graded ring $H^*(\mathcal{H}_G)$.

The hard Lefschetz map commutes with the action of $\mathfrak{S}_n$. 
Consequences of our conjecture

Let $G$ be a natural unit interval graph. The conjecture

$$\omega X_G(x, t) = \sum_{j \geq 0} \text{ch} H^{2j}(\mathcal{H}_G) t^j$$

has the following consequences.

**Combinatorial consequences:**
- $X_G(x, t)$ is Schur-positive and **Schur-unimodal**.
- Generalized $q$-Eulerian polynomials $A_n^{(r)}(q, t)$ are **$q$-unimodal**.

**Algebro-geometric consequences:**
- Multiplicity of irreducibles in Tymoczko’s representation can be obtained from our expansion of $X_G(x, t)$ in Schur basis.
- Character of Tymoczko’s representation can be obtained from our expansion of $X_G(x, t)$ in power-sum basis.

So our conjecture is a two-way bridge between combinatorics and algebraic geometry.
Brosnan and Chow prove our conjecture!

**Theorem (Brosnan and Chow (2015), Guay-Paquet (2016))**

Let $G$ be a natural unit interval graph and let $\text{ch}H^j(\mathcal{H}_G)$ be the Frobenius characteristic of Tymoczko’s representation of $\mathfrak{S}_n$ on $H^j(\mathcal{H}_G)$. Then

$$\omega X_G(x, t) = \sum_{j \geq 0} \text{ch}H^j(\mathcal{H}_G)t^j.$$
Brosnan and Chow prove our conjecture!

**Theorem (Brosnan and Chow (2015), Guay-Paquet (2016))**

Let $G$ be a natural unit interval graph and let $\text{ch} H^2 j (\mathcal{H}_G)$ be the Frobenius characteristic of Tymoczko’s representation of $\mathfrak{S}_n$ on $H^2 j (\mathcal{H}_G)$. Then

$$\omega X_G(x, t) = \sum_{j \geq 0} \text{ch} H^2 j (\mathcal{H}_G) t^j.$$ 

- Brosnan and Chow reduce the problem of computing Tymaczko’s representation of $\mathfrak{S}_n$ on regular semisimple Hessenberg varieties to that of computing the Betti numbers of regular (but not nec. semisimple) Hessenberg varieties. To do this they use results from the theory of local systems and perverse sheaves. In particular they use the local invariant cycle theorem of Beilinson-Bernstein-Deligne.

- Guay-Paquet introduces a new Hopf algebra on labeled graphs to recursively decompose the regular semisimple Hessenberg varieties.
Other recently discovered connections with $X_G(x, t)$

Extension of p-positivity result.

**Theorem (Ellzey (2016))**

If $G$ is a labeled graph for which $X_G(x, t)$ is symmetric then $\omega X_G(x, t)$ is p-positive.
Other symmetric $X_G(x, t)$

Extension of p-positivity result.

**Theorem (Ellzey (2016))**

*If $G$ is a labeled graph for which $X_G(x, t)$ is symmetric then $\omega X_G(x, t)$ is p-positive.*

Quasisymmetric power-sum functions: Ballantine, Daugherty, Hicks, Mason, and Niese (2017)

**Theorem (Alexandersson-Sulzgruber (2018))**

*For any labeled graph $G$, the chromatic quasisymmetric function $\omega X_G(x, t)$ is quasisymmetric p-positive.*

The proof uses Ellzey’s techniques.
Other symmetric $X_G(x, t)$

$C_8 = \begin{array}{c}
\begin{array}{cccccccc}
7 & 8 & 1 & 2 & 3 & 6 & 5 & 4 \\
1 & 2 & 3 & 4 & 5 & 6 & 7 & 8
\end{array}
\end{array}$

not a unit interval graph

Theorem (Stanley (1995))

$X_{C_n}(x)$ is e-positive for all $n \geq 2$.

Theorem (Ellzey-W. (2018))

$X_{C_n}(x, t)$ is e-positive for all $n \geq 2$.

Are there any other labeled connected graphs whose chromatic quasisymmetric function is symmetric besides for the natural unit interval graphs and the naturally labeled cycle?
Other symmetric $X_G(x, t)$

$C_8 = \begin{array}{cccccccc}
